Recycled Content& Environmental Information on our Baxter Produced Products

The recycled content for our products produced, in Baxter Tennessee, is one of the highest in the industry.

We recycle 100% of our process water in a closed loop system.

Most of our materials are sourced locally from Tennessee or an adjoining state. Many of the body components are 'leftovers' from other processes. This waste would be classified as postindustrial.

The unfired (green), fired (bisque) scrap, and glaze waste are normal additions to our body formulation.

In total, by dry solid volume, **62%** of our body formulation consists of these materials.

Our products are fired with natural gas with state-of-the-art emissions control systems. In terms of electricity, 13.5% of this comes from TVA renewable sources.

Feel free to contact us if you have any questions on these topics.

A handwritten signature in black ink that reads "James Neel".
